Guide

Uma Maheswari

Institution:

National Post Graduation College, Lucknow

Year - 2026

3. Problem Statement

- **Background of the Domain:**

Educational institutions collect large amounts of academic data such as student marks, attendance records, grades, and participation in academic activities. However, this data is often stored in raw or scattered formats, making it difficult to analyze and use effectively for decision-making.

- **Data-Related Challenges:**

Academic datasets may contain inconsistencies such as duplicate entries, missing values, and non-standardized fields (for example different spellings of subject names). Without proper data cleaning and structuring, it becomes difficult to extract reliable insights from the data.

- **Significance of the Problem (Real-World Context):**

Institutions often allocate academic support resources equally across subjects without identifying which subjects or students require the most attention. This can lead to inefficient use of resources and delayed identification of students who are academically at risk.

- **Gap or Inefficiency Addressed by the Project:**

There is a lack of a centralized system that converts raw academic data into clear, visual insights. Without proper analysis and dashboards, administrators cannot easily identify trends such as subject difficulty, grade distribution, pass-fail rates, or the relationship between attendance and academic performance.

- **Stakeholders Affected:**

Students, faculty members, and institutional administrators are affected by this problem. Students may not receive timely academic support, faculty lack clear insights into performance patterns, and administrators struggle to make data-driven decisions.

- **Value Delivered by the Solution:**

This project develops an Academic Resource Optimization Dashboard using Microsoft Excel that cleans, analyzes, and visualizes student performance data. The dashboard will help stakeholders identify at-risk students, understand key performance trends, and support better academic planning and resource allocation.

4. Project Objectives

- To collect and explore the raw dataset and understand its structure, fields, and possible data quality issues.
- To clean and preprocess the dataset by removing duplicates, handling missing values, correcting formats, and standardizing fields using Microsoft Excel tools.
- To perform data analysis using Excel functions and pivot tables in order to derive meaningful insights from the dataset.
- To build an interactive dashboard in Microsoft Excel that clearly communicates key insights and performance indicators to stakeholders.
- To use AI tools such as Microsoft Copilot or AI chatbots to assist in generating summaries, insights, and documentation related to the analysis.
- To document the complete project workflow and prepare the final report, along with uploading the project files and demonstration materials as required for submission.
- Project-Specific Objective: To design an Academic Resource Optimization Dashboard in Microsoft Excel that analyzes student performance indicators such as subject-wise scores, grade distribution, attendance impact, and pass–fail trends to support data-driven academic decision-making.

5. Methodology / Implementation Plan

This project was executed following a structured five-phase workflow, combining traditional data analysis techniques in Excel with Generative AI for logic architecture:

#	Phase	Description
1	Data Collection & Exploration	Obtained the initial raw sample dataset of 30 student records. Explored the structure, field names (e.g., Student ID, Marks, Internet Access), and identified critical data quality issues, such as numerical marks being stored as text.
2	Data Cleaning & Preprocessing	Sanitized the data in Excel by converting text-based marks into calculable numbers using the =VALUE() function. Standardized categorical text formats (e.g., "Yes/No") and utilized the "Remove Duplicates" feature to ensure a clean foundational dataset.
3	Analysis & AI Integration	Scaled the database from 30 to 500 rows using =RANDBETWEEN and =VLOOKUP. Consulted Google Gemini as an AI Logic Architect to generate a complex nested =IFS(AND(...)) formula, which accurately categorized students' "Resource Need" based on their academic performance and digital access.
4	Visualization / Output	Built an interactive diagnostic dashboard in Excel using Pivot Tables and Pivot Charts. Visualized actionable insights, including the exact percentage of students facing the "Digital Divide" and a dynamic leaderboard of top performers.
5	Documentation & Submission	Compiled this comprehensive project report detailing the workflow and AI prompts. Uploaded the final 500-row Excel database and documentation to a GitHub repository.

6. Resources and Timeline

A. Hardware & Software Requirements

- Laptop or PC — Intel Core i3 or higher, minimum 4 GB RAM (8 GB recommended)
- Operating System: Windows 10 / 11 or macOS
- Microsoft Excel (Microsoft 365 / Excel 2019 or later)

- AI Chatbot (Google Gemini) — for prompt-based projects
- Internet connection — A stable connection is strictly required to consult Google Gemini, download the initial Edunet dataset, and upload the final project files to GitHub.
- Web browser — Google Chrome or Microsoft Edge (latest version)

B. Dataset

- **Source and Availability:** The foundational dataset containing student academic and demographic records (e.g., Student ID, Class, Subject, Marks, Attendance, Internet Access) was entirely AI-generated. It was sourced directly from Google Gemini through targeted prompt engineering, rather than a pre-existing public or provided database.
- **Data Generation and Simulation:** Gemini was used to synthesize a realistic baseline of student records. From this AI-generated foundation, Excel functions such as =RANDBETWEEN and =VLOOKUP were applied to scale the sample into a robust 500-record database. This ensured realistic variations in performance metrics (Marks and Attendance) while maintaining relational integrity across the rows.
- **AI Prompt Use Case Brief:** The primary use cases for AI in this project were "Data Synthesis" and "Logic Architecture." First, Gemini was prompted to generate the structured student dataset. Second, it was used to build a multi-conditional prioritization engine. The AI generated the complex nested =IFS and AND formulas required to automatically categorize the 500 students into "Critical," "Medium," or "Low" Resource Need tiers based on the "Digital Divide" (Marks < 50 and Lack of Internet Access).

C. Project Timeline

The following table outlines the planned tasks and expected completion dates across the 4-week fellowship period:

Phase	Task	Tentative Completion Date
-------	------	---------------------------

1	Dataset collection, exploration, and understanding: Generated the initial synthetic student data using Gemini and explored the baseline parameters (Marks, Attendance, Internet Access).	<i>Week 1</i>
2	Data cleaning, preprocessing, and validation / Prompt design: Corrected text-to-number errors, scaled the dataset to 500 rows using RANDBETWEEN and VLOOKUP, and engineered specific prompts for the AI Logic Architect.	<i>Week 2</i>
3	Analysis, AI tool integration, and insight generation: Integrated Gemini to generate complex nested IFS formulas, creating the "Resource Need" column to identify the "Digital Divide."	<i>Week 2 – 3</i>
4	Dashboard / output build, testing, and review: Built the interactive Excel Pivot Tables and Dashboard, generating visual charts for student prioritization and testing formula integrity.	<i>Week 3</i>
5	Report writing, GitHub upload, and submission: Finalized project documentation, uploaded the 500-row database to GitHub.	<i>Week 4</i>

7. Expected Outcomes

- To ensure the AI Logic Architect produced consistent results, the raw student data underwent a rigorous cleaning and scaling process. As seen in the comparison below, text-to-number mismatches were corrected, and the initial sample was expanded and standardized into distinct prioritization categories to enable reliable analytical dashboarding.

Figure 2: Validated Dataset featuring 500 unique records with standardized metrics, scaled attendance data, and AI-generated "Resource Need" categories.

Key Insights & Strategic Analysis

- **The Digital Divide Impact:** The AI-architected logic revealed a strong correlation between a lack of internet access and academic struggle. Students categorized as
- "Critical" predominantly lack digital resources at home, proving that infrastructure directly impacts passing rates.
- **Attendance vs. Performance:** While high attendance generally correlates with higher grades, the multi-conditional analysis showed that attendance alone cannot guarantee success if a student is lacking test preparation materials and internet access.
- **Targeted Resource Allocation:** By segmenting the 500-student database into four distinct tiers (Critical, High, Medium, Low), school administrators can transition from a "guesswork" approach to a data-driven strategy, prioritizing immediate budget and intervention efforts on the most vulnerable students.

Figure 3: The Resource Need distribution chart confirms that over a quarter (29%) of the student body requires immediate intervention. This data-driven insight validates the use of the AI Logic Architect to automatically segment the database, allowing administrators to target vulnerable students efficiently.

Figure 4: This chart illustrates the impact of test preparation course completion on students' average subject marks. It shows that students who completed the test preparation course consistently achieved higher average scores in all subjects—English, Math, and Science—compared to those who did not participate, highlighting the positive effect of structured preparation on academic performance.

Figure 5: This scatter plot shows the relationship between student attendance and academic performance. The upward trend indicates a positive correlation, where students with higher attendance percentages tend to achieve better marks, highlighting the importance of regular class participation in improving academic outcomes.

Demonstration of AI Tool Usage (Google Gemini)

To successfully scale the dataset and build the "Digital Divide" prioritization engine, Google Gemini was utilized as a data generation and logic architecture tool. Below are the prompts engineered to achieve these technical outcomes.

Figure 6: The initial Data Generation prompt given to Google Gemini, establishing the structure and parameters for the 500-record student database

Figure 7: Gemini's response, providing the foundational synthetic data and the RANDBETWEEN and VLOOKUP logic needed to scale the sample.

Figure 8: The "Logic Architect" prompt. Here, Gemini was provided with the specific multi-conditional rules for the "Digital Divide" (correlating Marks < 50 and Internet Access = "No").

Figure 9: Gemini's generated output, providing the complex nested `=IFS(AND(...))` formula that was directly copied into Excel to automate the "Resource Need" categorization.
